Module Name: BVA & Equivalence Partitioning – Instagram Bio & Caption Hashtag Fields

Test Case ID: st_07

Tester Name: Aman Sevak

Application: Instagram (Mobile App)

Aim: To apply Boundary Value Analysis (BVA) and Equivalence Partitioning techniques for validation testing of forms and authentication modules.

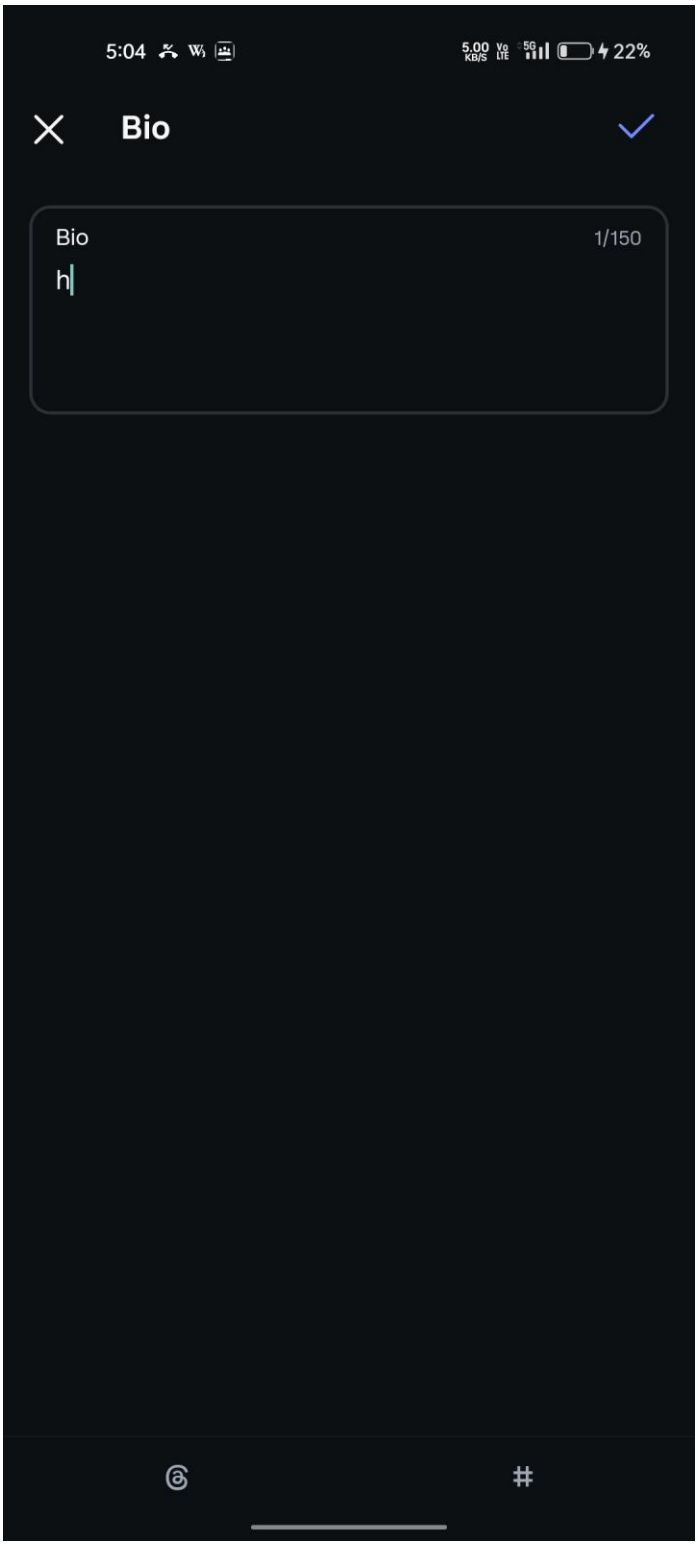

Scenario ID: 1a

Scenario: Bio field – enter minimum valid input (1 character)

Test Steps:

1. Open Instagram app and go to Profile > Edit Profile > Bio
2. Enter a single character in the Bio field
3. Observe the character counter

Screenshot:

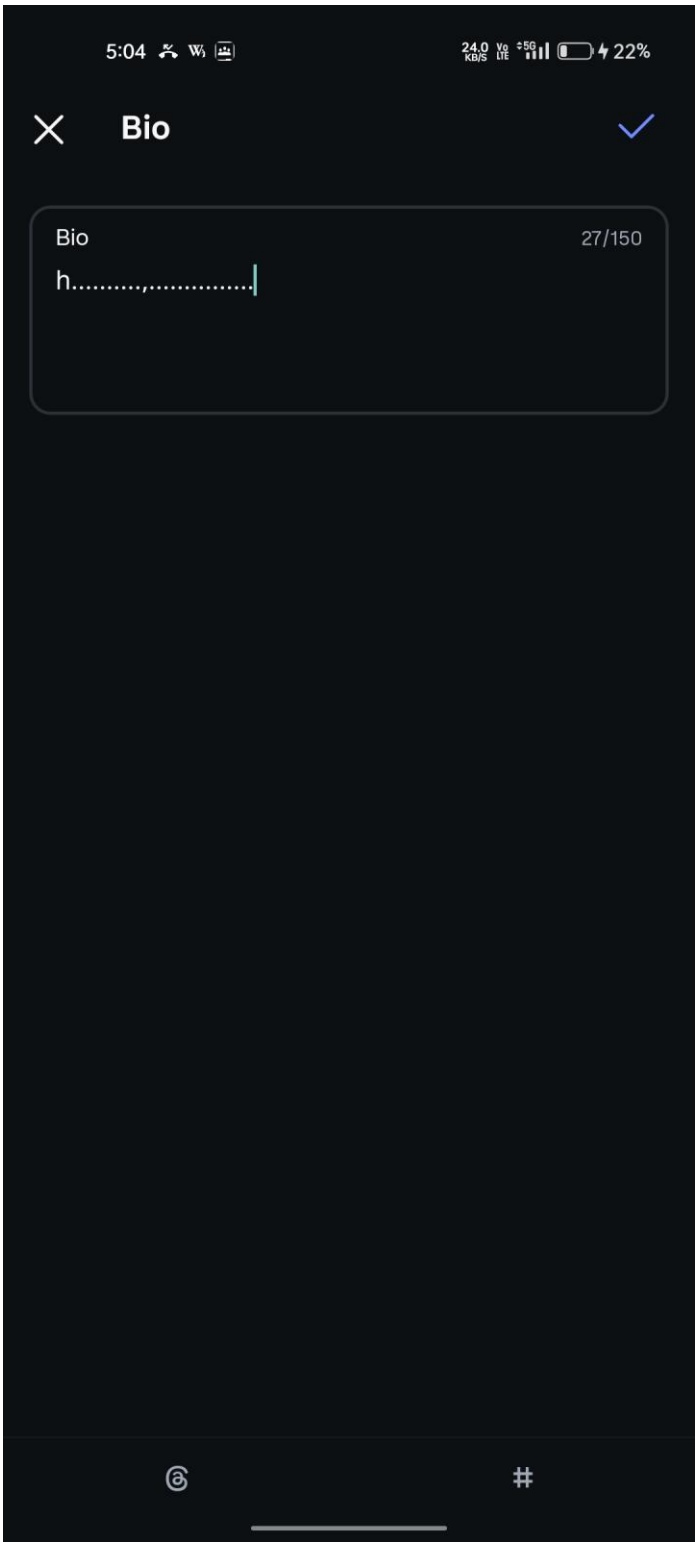

Scenario ID: 1b

Scenario: Bio field – enter a valid mid-range input (27 characters)

Test Steps:

1. Continue typing in the Bio field
2. Enter text until the counter reaches 27 characters
3. Observe the character counter

Screenshot:

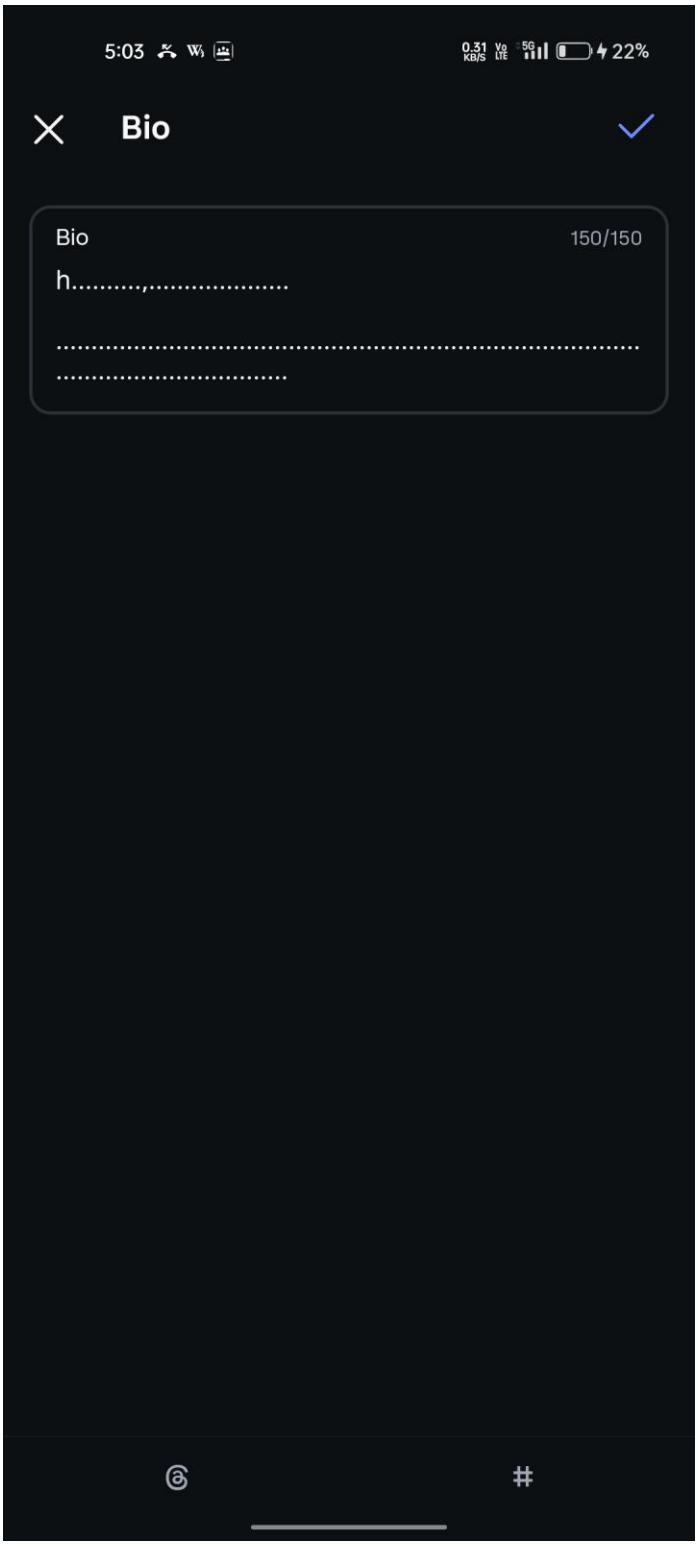

Scenario ID: 1c

Scenario: Bio field – enter maximum boundary input (150 characters) and attempt to exceed it

Test Steps:

1. Continue typing in the Bio field beyond 27 characters
2. Keep typing until the character counter reaches the limit
3. Attempt to type additional characters after the limit is reached

Screenshot:

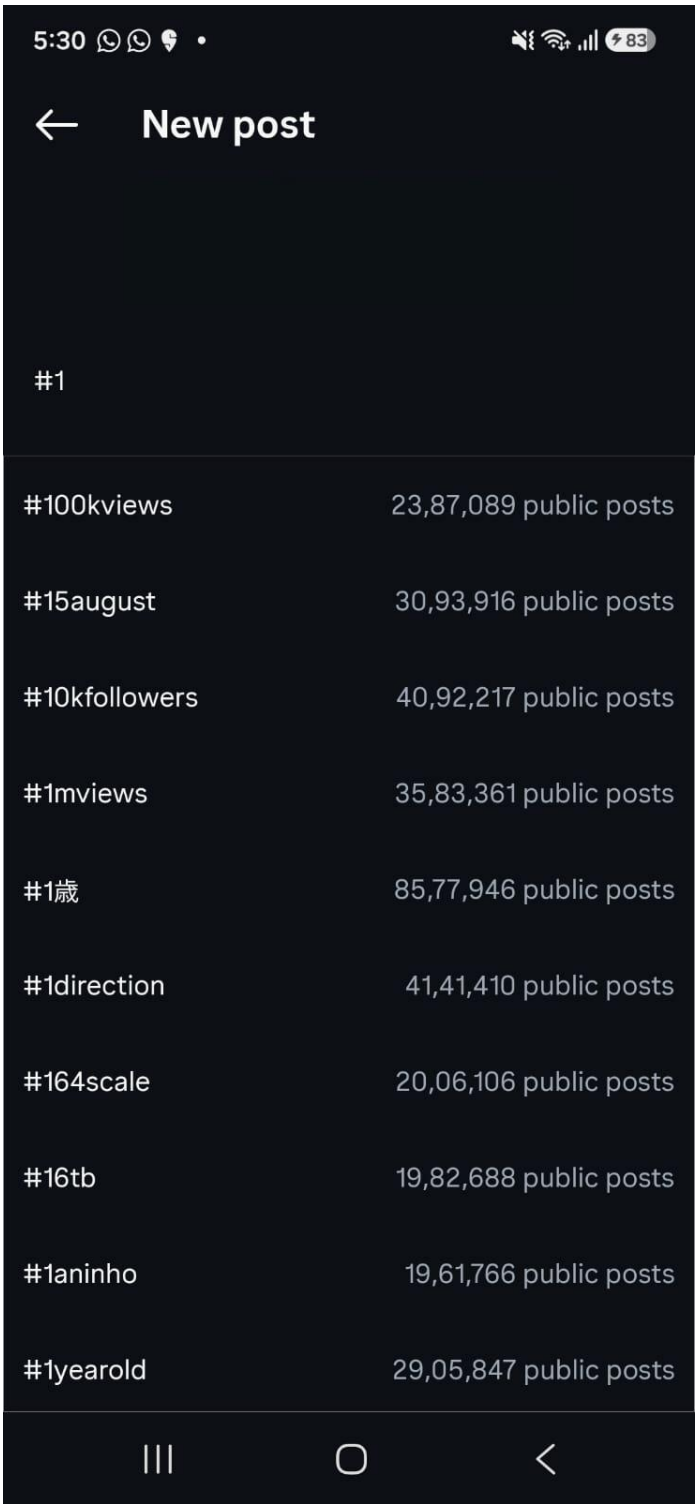

Scenario ID: 2a

Scenario: Caption field – enter a valid hashtag (equivalence class: valid hashtag input)

Test Steps:

1. Go to New Post > Add Caption
2. Type a hashtag, e.g. "#1"
3. Observe the hashtag suggestion list

Screenshot:

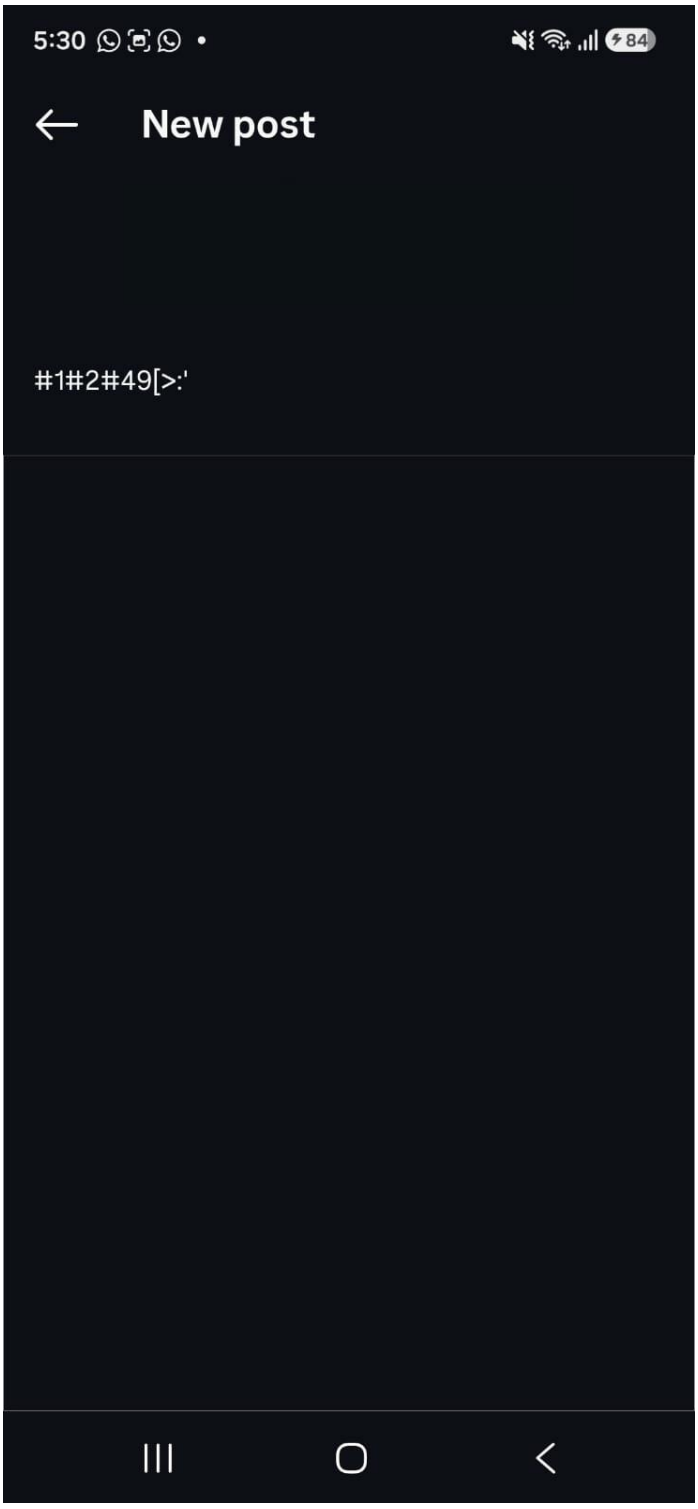

Scenario ID: 2b

Scenario: Caption field – enter multiple hashtags approaching the allowed limit

Test Steps:

1. Continue typing in the Caption field
2. Add several hashtags/symbols in sequence
3. Observe whether the input is accepted

Screenshot:

Scenario ID: 2c

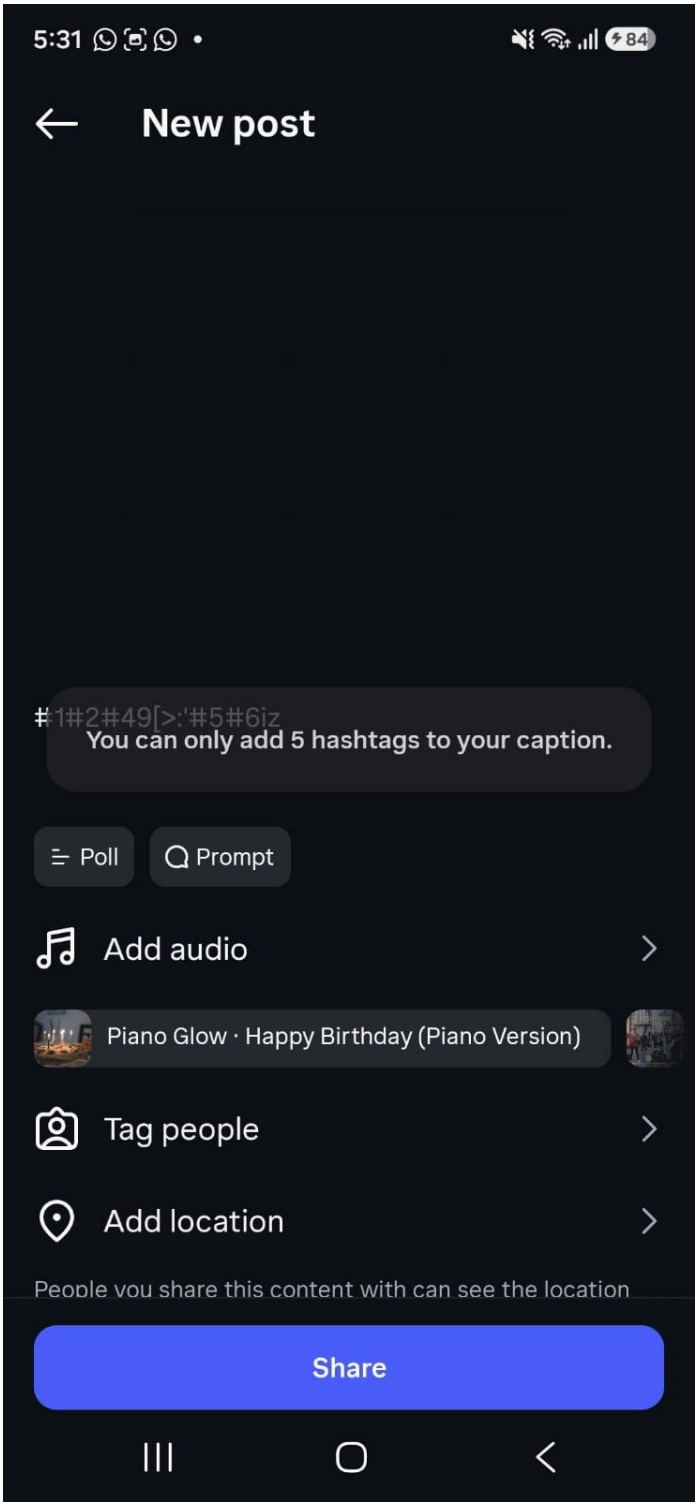

Scenario: Caption field – exceed maximum hashtag limit (6th hashtag, upper boundary + 1)

Test Steps:

1. Continue adding hashtags in the Caption field beyond 5

2. Attempt to add a 6th hashtag
3. Observe the system response

Screenshot:

Summary of Test Results

Total Test Cases: 6

Passed: 6

Failed: 0

Pass %: 100%

Conclusion and Recommendations

Pass Rate: 100% — Boundary handling working as expected.

Both fields tested (Bio and Caption Hashtags) correctly enforced their defined boundaries. The Bio field accepted input from the minimum (1 character) through the maximum boundary (150 characters) and correctly blocked further input beyond the limit. The Caption field allowed hashtag entry within the valid range and correctly displayed a warning message when the user attempted to add a 6th hashtag, confirming the 5-hashtag upper boundary is enforced.

Issues Found

No defects were found during this round of testing. Both the Bio character limit (150) and the Caption hashtag limit (5) were enforced correctly with appropriate boundary and equivalence class behavior.

Recommendations

1. Continue to include boundary and equivalence partitioning checks (min, min+1, max-1, max, max+1) for all remaining input fields (Username, Full Name, Password) to ensure consistent validation coverage.
2. Consider surfacing an on-screen warning as the Bio counter approaches its maximum (e.g., at 140/150) rather than only blocking input silently at the cap.
